INTRODUCTION

San Francisco

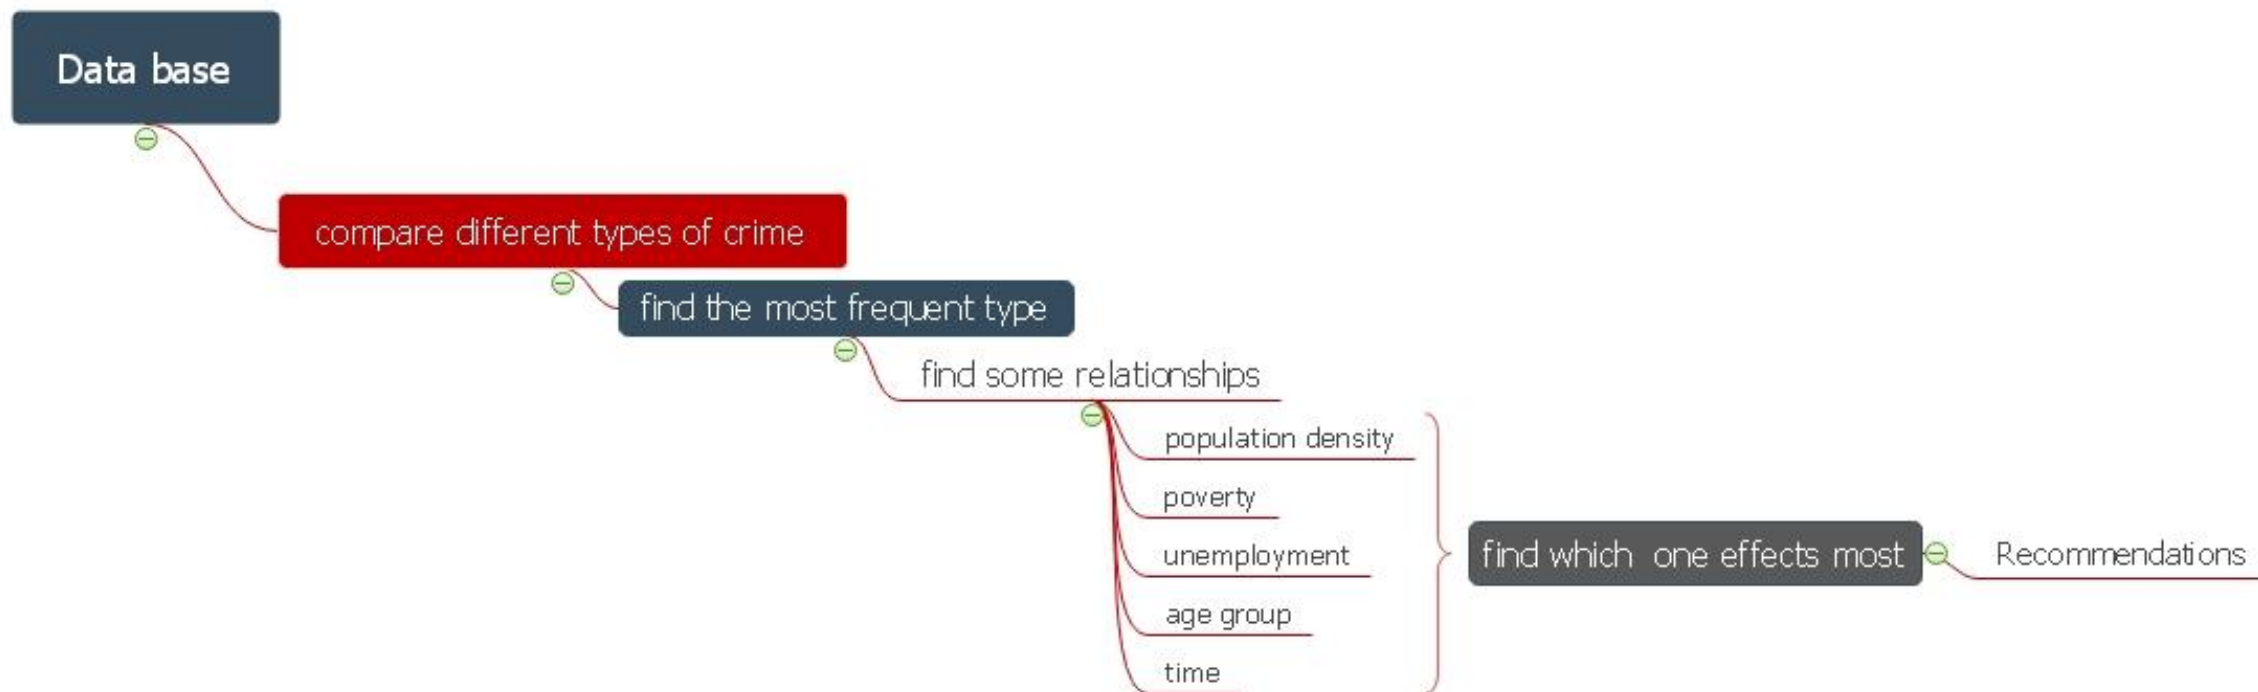

San Francisco officially called the City and County of San Francisco, is a city in, and the cultural, commercial, and financial center of, Northern California.

San Francisco is the 13th-most populous city in the United States, and the fourth-most populous in California, with 883,305 residents as of 2018. It covers an area of about 46.89 square miles (121.4 km²).

ABSTRACT

Total Crime Based on Category

The most frequent type

2

DATA ANALYSIS

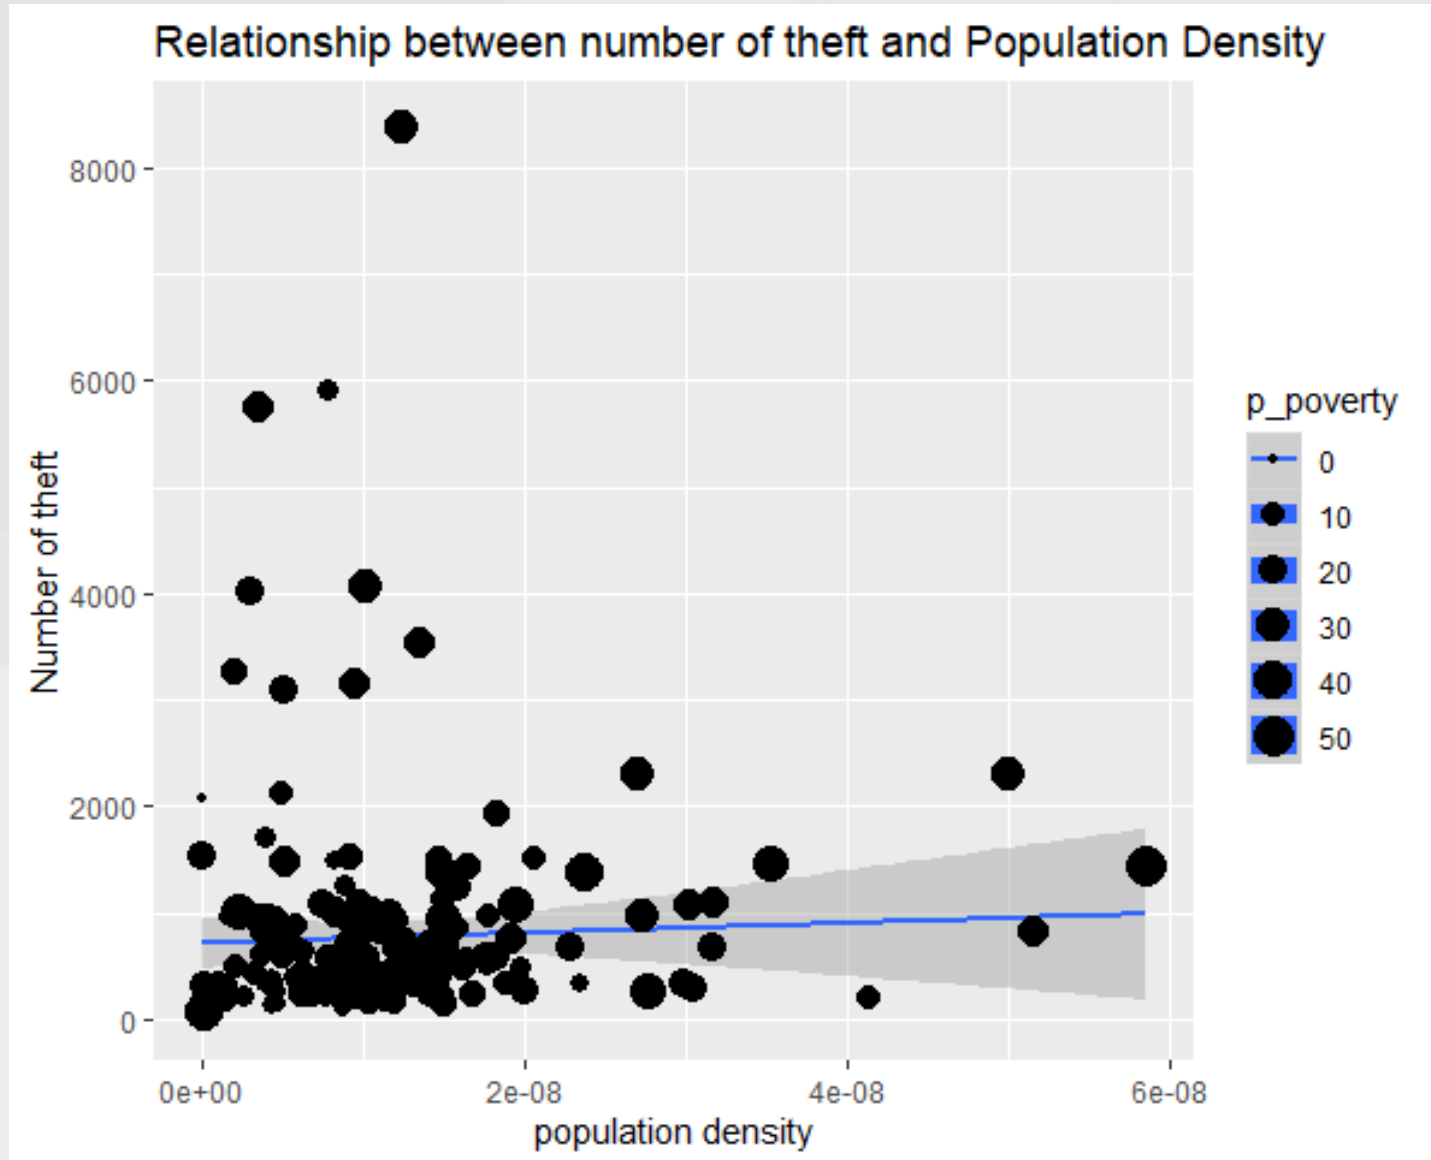

Population density

1.> TO PERFORM INNER JOIN

```
dsPlot <- crime_SFO %>%  
  filter ( Category == 'LARCENY/THEFT' ) %>%  
  group_by ( Tract ) %>%  
  summarise ( total_crime = n() ) %>%  
  inner_join ( census_SFO, by = c ( "Tract" = "censustract" ) )
```

2.> TO CREATE A SCATTER PLOT

```
dsPlot %>%  
  ggplot( aes ( x = pop_den, y = total_crime, size = p_poverty ) ) +  
  geom_smooth ( method = 'lm' ) +  
  geom_point ( ) +  
  labs ( title ="relationship with population density",x="Population density",y="Number of theft/larceny")
```

- It seems that there is no significant relationship between the number of theft and population density,
- However, in when population becomes larger, the confident interval also increases, therefore, there is more uncertainty of our result.

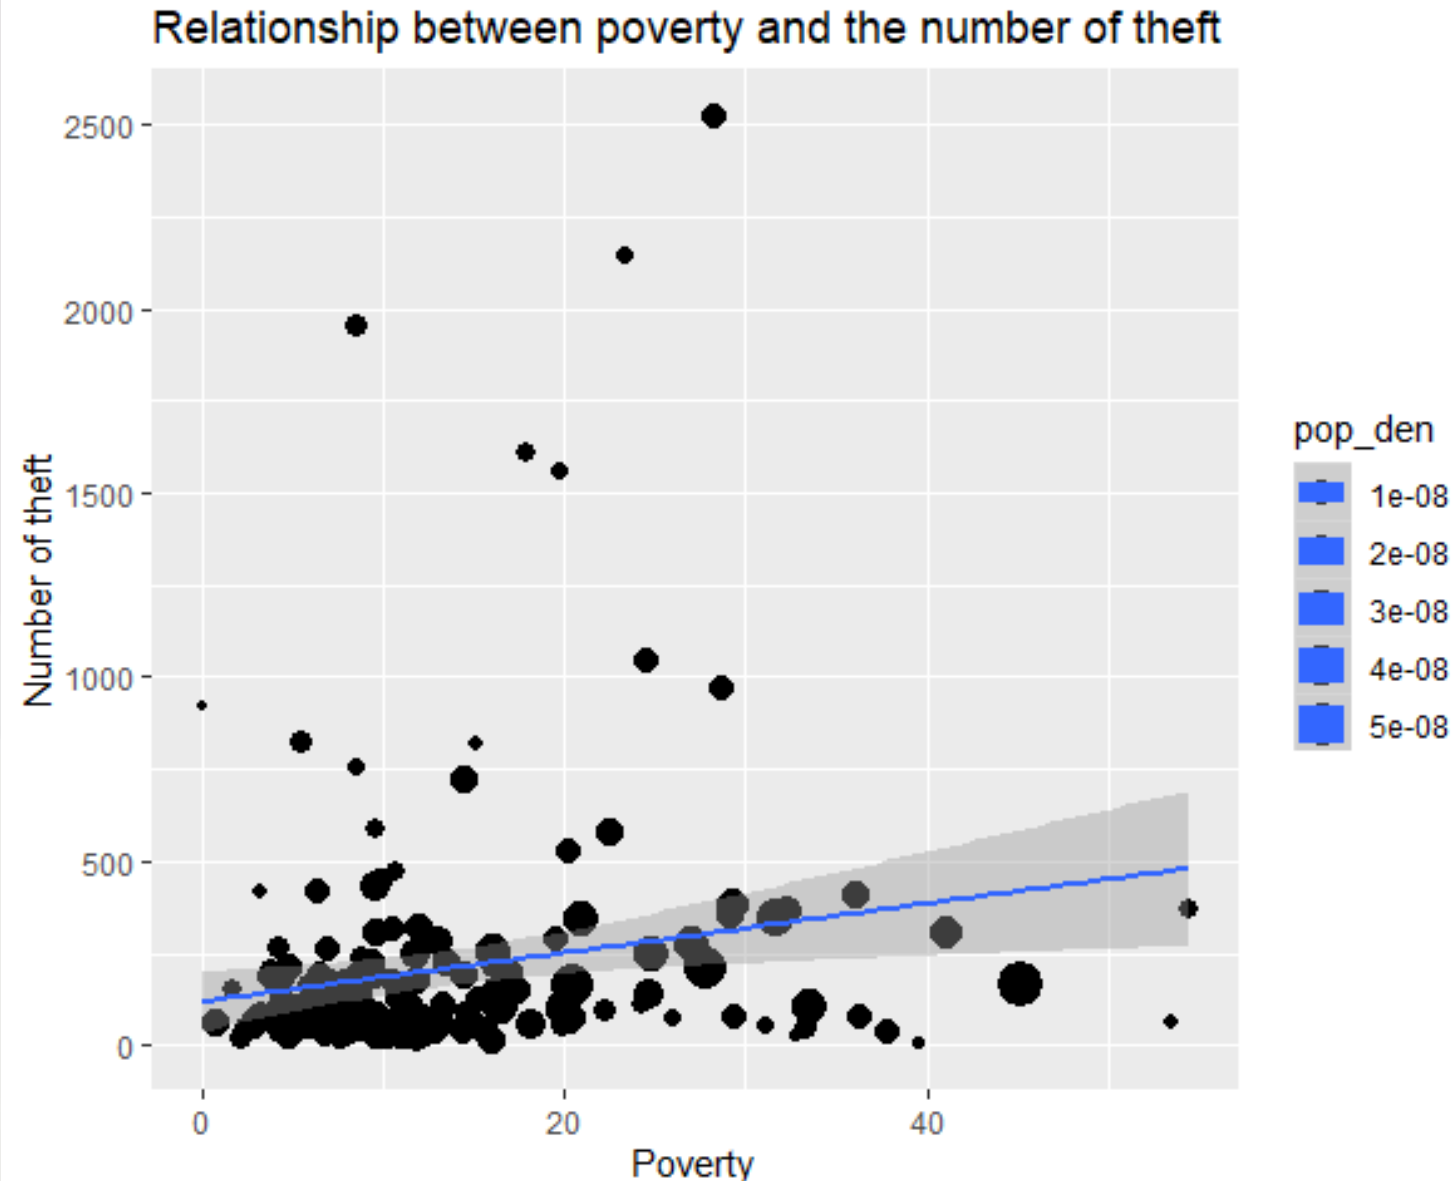

Poverty

1.> TO PERFORM INNER JOIN

```
dsPlot <- crime_SFO %>%  
  filter(Category=='LARCENY/THEFT')%>%  
  group_by(Tract) %>%  
  summarise(total_crime=n()) %>%  
  inner_join(census_SFO, by = c("Tract" = "censustract"))
```

2.> TO CREATE A SCATTER PLOT

```
dsPlot %>%  
  ggplot(aes(x=p_poverty, y=total_crime, size=pop_den))+  
  geom_smooth(method = 'lm')+  
  geom_point()+labs(title="relationship with poverty",x="Poverty",y="Number of theft/larceny")
```

- It's very evident that poverty does not stand behind to fuel the increase in crime rates.
- As the poverty increases, we see that the crime rates follow a positive growth.

Unemployment rate

```
Unemployment_rate <- crime_SFO %>%  
  filter(Category == 'LARCENY/THEFT') %>%  
  group_by(Tract) %>%  
  summarise(total_crime = n(), Unemployment = mean(Unemployment)) %>%  
  inner_join(census_SFO, by = c("Tract" = "censustract")) %>%  
  ggplot(aes(x = Unemployment, y = total_crime, size = pop_den)) +  
  geom_smooth(method = 'lm') +  
  geom_point() +  
  labs(title = "relationship between unemployment rate and the number of crime",  
        x = "Unemployment rate",  
        y = "Number of theft")
```

Unemployment_rate

relationship between unemployment rate

- Common theory in public policymaking is that higher unemployment causes higher rates.
- Individuals who are underemployed are significantly less likely to be involved in a burglary than someone who is working full-time. Underemployed people, however, are not much less likely to commit robbery.
- People who are unemployed and seeking work are no more likely to commit robbery or burglary than individuals with full-time jobs.

Age group

1.> TO PERFORM INNER JOIN

```
dsPlot <- crime_SFO %>%  
  filter(Category=='LARCENY/THEFT')%>%  
  group_by(Tract) %>%  
  summarise(total_crime=n()) %>%  
  inner_join(census_SFO, by = c("Tract" = "censustract"))
```

Age group

2.> TO MERGE THREE SCATTER PLOT INTO ONE GRAPH

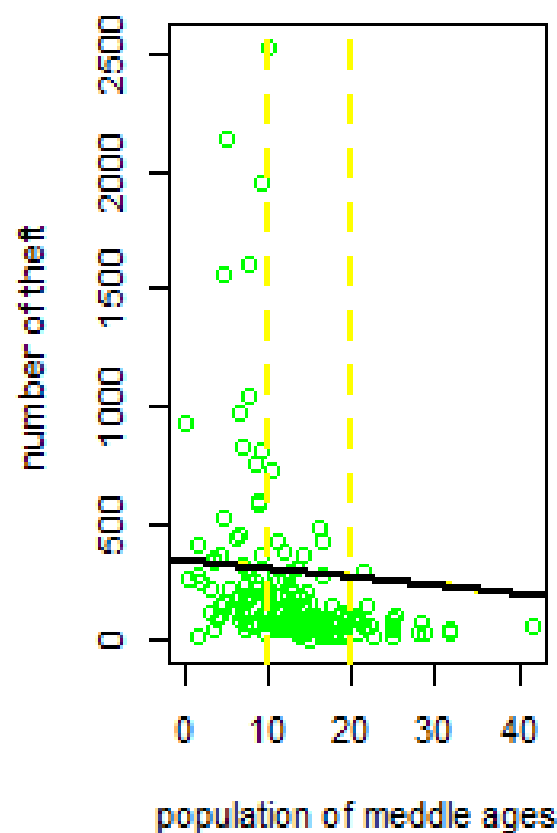

```
par(mfrow = c(1,3))
with(dsPlot, {
  plot(p_kids, total_crime, xlab="population of kids", ylab="number of theft", main = "kids and theft",col="blue")
  fit1 <- lm(total_crime~p_kids)
  abline(fit1,v=10,lty=2,lwd=2,col="yellow")
  abline(fit1,v=20,lty=2,lwd=2,col="yellow")
  abline(fit1,lwd=2)
  plot(p_kids, total_crime, xlab="population of meddle ages", ylab="number of theft",main = "meddle ages and
theft",col="green")
  fit2 <- lm(total_crime~med_age)
  abline(fit2,v=10,lty=2,lwd=2,col="yellow")
  abline(fit2,v=20,lty=2,lwd=2,col="yellow")
  fit2 <- lm(total_crime~med_age)
  abline(fit2,lwd=2)
  plot(p_seniors, total_crime, xlab = "population of seniors", ylab="number of theft", main = "seniors and theft",col="red")
  fit3 <- lm(total_crime~p_seniors)
  abline(fit3,v=10,lty=2,lwd=2,col="yellow")
  abline(fit3,v=20,lty=2,lwd=2,col="yellow")
  abline(fit3,lwd=2))}
```

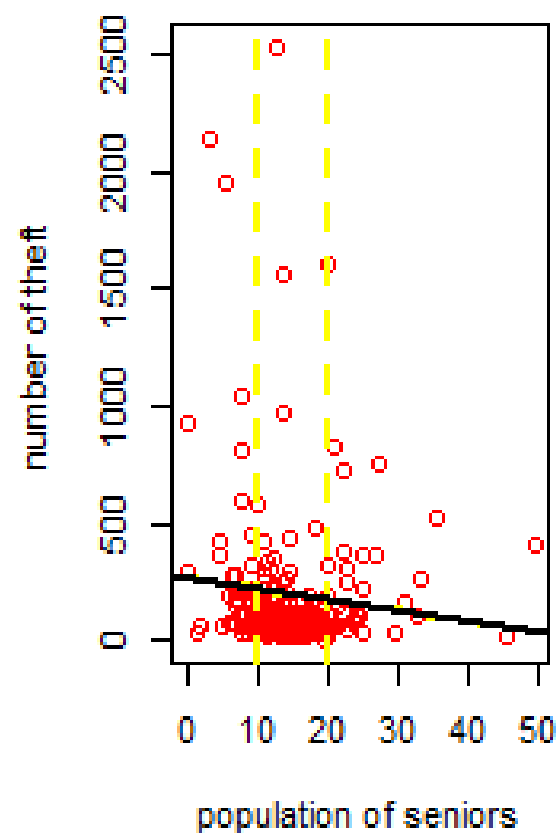

kids and theft

meddle ages and theft

seniors and theft

Model testing

Time: days of week

1.> TO CALCULATE THE TOTAL NUMBER OF THEFT PER DAY

```
dsPlot <- crime_SFO %>%  
  group_by(DayOfWeek) %>%  
  summarise(total_crime=n()) %>%  
  mutate(DayOfWeek= factor(DayOfWeek, levels =  
    c("Monday","Tuesday","Wednesday","Thursday","Friday","Saturday","Sunday")))
```

2.> TO CREATE A SCATTER PLOT

```
dsPlot%>%  
  ggplot(aes(x=DayOfWeek,y=total_crime)) +  
  geom_bar(stat='identity',color='navyblue',fill='navyblue')+  
  theme(axis.text.x = element_text(angle = 90))+  
  labs(title="number of theft change over time in a week", x="days of week", y="number of theft")
```

Based on days of week

Time: hour

1.> TO CALCULATE THE TOTAL NUMBER OF THEFT PER HOUR

```
dsPlot2 <- crime_SFO %>%  
  group_by(Time) %>%  
  summarise(total_crime=n())
```

2.> TO CREATE A SCATTER PLOT

```
dsPlot2%>%  
  ggplot(aes(x=Time,y=total_crime)) +  
  geom_bar(stat='identity',color='navyblue',fill='navyblue')+  
  theme(axis.text.x = element_text(angle = 90))+  
  labs(title="number of theft change over time in a day", x="hour", y="number of theft")
```

Based on hours
